

Worksheet: Digital Identity Audit

Name: ____ **Date:** ____

This worksheet is private — you will not be asked to read it aloud or share it with the class. Answer honestly. If you don't have much of an online footprint yet, that's a completely normal answer — just say so.

Section 1: Current Online Footprint Inventory

List anything that currently exists about you online. If you have little or none, write "No significant footprint yet" in the first row and move on to Section 2.

Where (platform/site)	What's there	Does it show a skill or achievement? (Y/N)	How would a stranger read it?
<i>Example:</i> GitHub	Two repos: a documented weather app, one unfinished sketch app	Y	"Looks like a real coder, but one repo looks abandoned."

Section 2: Gaps or Risks I Noticed

List anything from Section 1 (or anything you know is out there) that feels incomplete, outdated, confusing, or that you wouldn't want a stranger to see first.

1. _____

2. _____

3. _____

Section 3: Three Things I Want People to Know About Me Professionally

These should be honest and specific — not generic ("I'm hardworking") but tied to something real about how you work or what you're good at.

1. _____

2. _____
3. _____

Section 4: Three Pieces of Real Evidence I Already Have

These can be from Lumexa projects or anywhere else (school, personal projects, clubs). For each one, briefly describe what it is and what it proves.

#	Evidence (project/work)	What it proves
1		
2		
3		

Section 5: One Goal for This Course

By the end of Course 16, what do you want your professional identity to look like or be able to do? Be specific.

Example (Filled In) — Fictional Student

Note: "Jordan R." is a fictional example for teaching purposes only, not a real student.

Name: Jordan R., age 16

Section 1 Example Row

Where (platform/site)	What's there	Does it show a skill or achievement? (Y/N)	How would a stranger read it?
GitHub	Two repos: one documented weather app with a clear README, one unfinished sketch app with no description	Y	"This person can build working apps, but the unfinished repo makes it look inconsistent."

Section 2 Example

1. My unfinished GitHub repo has no README, so nobody can tell what it's for.

2. My social media has nothing related to coding — it doesn't help or hurt, but it's not useful either.
3. I don't have anything that pulls my best work into one place.

Section 3 Example

1. I can turn a rough idea into a working app, not just a plan.
2. I write code that other people can actually understand and reuse.
3. I stick with a project until it's genuinely finished, not just "mostly working."

Section 4 Example

#	Evidence (project/work)	What it proves
1	Weather app built on Lumexa, fully working with a clean interface	I can build a complete, functioning app from start to finish
2	Documented GitHub repo with a clear README	I can explain my own code clearly to someone else
3	Helped a classmate debug a loop error during a live class	I understand fundamentals well enough to explain them, not just use them

Section 5 Example

"By the end of this course, I want a simple portfolio site that shows my three best projects clearly, with a short case study for each one explaining what I built and why — so if someone looks me up, they see real proof instead of just a name."
